## Background & Purpose

Every day, more than 115 people in the United States die after overdosing on opioids. The misuse of and addiction to opioids – including prescription pain relievers, heroin, and synthetic opioids such as fentanyl – is a serious national crisis that affects public health as well as social and economic welfare. The Centers for Disease Control and Prevention estimates that the total "economic burden" of prescription opioid misuse alone in the United States is \$78.5 billion a year, including the costs of healthcare, lost productivity, addiction treatment, and criminal justice involvement.

The purpose of this report is to provide timely, accurate and consistent data on the prehospital administration of naloxone by bystanders, law enforcement, fire department, and EMS personnel to suspected opioid overdose patients in the S-SV EMS ten (10) county region. Due to the unknown etiology of presenting signs and symptoms in some prehospital patients, naloxone is occasionally administered to patients who are subsequently determined to not be suffering from an opioid overdose. It should also be noted that EMS personnel do not make medical diagnoses and do not have access to laboratory tests needed to confirm an opioid overdose. As a result, S-SV EMS quality improvement personnel thoroughly review all patient records involving the prehospital administration of naloxone to identify/confirm patients with a high likelihood of an opioid overdose prior to including the data in this report.
