

Airway & Ventilation Management

Approval: Troy M. Falck, MD – Medical Director

Effective: 10/01/2025

Approval: John Poland – Executive Director

Next Review: 07/2028

INDICATIONS

- Airway & ventilation management techniques may include: basic airway maneuvers, use of airway adjuncts (oropharyngeal/nasopharyngeal airways & supraglottic airway devices) based on the situation – Indications for airway management may include but are not limited to:
 - Obstructed airway
 - Respiratory distress/failure
 - Altered mental status
 - Severe shock (hemorrhagic, septic, cardiogenic)
 - Cardiac arrest
 - Trauma/burns/smoke inhalation
- During cardiac arrest, advanced airway placement should not delay or interrupt CPR & shall not be considered until after the 1st round of defibrillation (if indicated) & administration of epinephrine

BLS AIRWAY PROCEDURE

- Look, Listen, and Feel for level of responsiveness, chest movement, breath sounds, obstructions
- Positioning of unresponsive pts:
 - Place in the Head Elevated Laryngoscopy Position (HELP) to facilitate alignment of the pharyngeal, laryngeal & oral axis of the airway
 - Use the Head-Tilt/Chin-Lift, Jaw-Thrust, or Lateral Recovery Position (as appropriate)
- Remove visible obstructions &/or suction fluids as necessary, limiting suctioning to 10-15 secs
- Maintain airway patency – insert OPA/NPA as appropriate

**BAG-VALVE-MASK (BVM) VENTILATION PROCEDURE*****BVM ventilation should be performed by two rescuers whenever possible***

- Attach oxygen to BVM at a minimum flowrate of 10-15 L/min
- For one rescuer ventilation, position the mask over the nose & mouth & ensure a tight seal with an E-C clamp technique
- Squeeze the bag slowly, delivering breath over 1-2 secs
- Deliver only enough volume to achieve normal chest rise & fall
avoid excessive ventilation
- If utilizing a Positive End Expiratory Pressure (PEEP) valve, maintain between 5-10 cmH₂O. Do not utilize PEEP in any of the following circumstances:
 - Suspected pneumothorax
 - Suspected TBI or increased intracranial pressure
 - Hypovolemic shock
- Ventilate to maintain SpO₂ & EtCO₂ within appropriate range for pt condition
- An Impedance Threshold Device (ITD) may be utilized in adult non-traumatic pulseless arrest pts; however, two rescuers are required to maintain effectiveness if no advanced airway is in place

Airway & Ventilation Management

i-gel SUPRAGLOTTIC AIRWAY (SGA) PROCEDURE**Contraindications:**

- Intact gag reflex
- Caustic ingestion
- Unresolved complete airway obstruction

Relative Contraindications:

- Trismus or limited ability to open the mouth
- Oral trauma
- Distorted anatomy that prohibits device placement

- Pre-oxygenate pt with high-flow O₂, via NRM or BVM as appropriate, for a minimum of 3 mins
- Administer 10-15 L/min O₂ via NC, in addition to NRM/BVM O₂ to augment pre-oxygenation
- Select the correct size i-gel SGA device
- Lubricate the back & sides of the i-gel SGA device with a water-based lubricant
- Place the pt in a sniffing position or use a Jaw-Thrust maneuver if spinal injury is suspected
- Grasp the i-gel SGA device by the proximal end with the dominant hand, making sure the cuff is pointing downwards & the airway tube is aligned in the midline
- Gently press down on the chin & introduce the soft tip into the mouth towards the hard palate
- Glide the i-gel SGA device downwards & backwards Along the hard palate with a continuous but gentle Push until a definitive resistance is felt
- Begin ventilating with a BVM at the appropriate ventilation rate
- Follow **ADVANCED AIRWAY DEVICE PLACEMENT CONFIRMATION & POST-PROCEDURE** instructions on page 3

**ADVANCED AIRWAY DEVICE PLACEMENT CONFIRMATION & POST-PROCEDURE**

- Using a stethoscope, check for the absence of gurgling sounds over the epigastrium & the presence of equal breath sounds over the lungs while observing for chest rise and fall. Gurgling may still be heard in pts who are breathing spontaneously or when an i-gel SGA device is in place
- Attach an EtCO₂ monitoring device, which must remain in place until arrival to the hospital or cessation of resuscitation efforts
- At least four (4) of the following techniques must be utilized to confirm advanced airway placement
 - Bilateral breath sounds
 - Bilateral chest rise and fall
 - Consistent EtCO₂ waveform
 - Change in Colorimetric CO₂ detector from purple to yellow
 - Condensation in the airway tube
 - SpO₂ rising to/or remaining above 94%
- LALS personnel must immediately confirm patency of an advanced airway placed by an EMT
- Airway patency must be reassessed at a minimum of every 15 mins and:
 - Each time the patient is moved
 - If ventilation becomes difficult
 - If vital signs, including SpO₂ & EtCO₂ change unexpectedly
- If a pt with an advanced airway in place regains consciousness:
 - Use restraints as necessary to avoid displacement of the advanced airway device
 - Consider sedation with **Midazolam 10 mg IV/IO/IM/IN (AEMT II)** for adult pts (may repeat x 1)
 - Contact base/modified base hospital for pediatric Midazolam dosing if needed
- Document all methods/devices used to confirm advanced airway device placement in the PCR
